Changes in Hospitalizations and In-Hospital Deaths for Adults Aged 18–64 Years in the Initial Period of the COVID-19 Pandemic (April–December 2020), 29 States

STATISTICAL BRIEF #292
April 2022

Lawrence D. Reid, Ph.D., M.P.H., and Marc Roemer, M.S.

Introduction

Annually, there are approximately 17.0 million hospitalizations for adults aged 18–64 years in the United States, including for medical conditions (43 percent), maternal conditions (23 percent), surgeries (21 percent), mental health and substance use conditions (9 percent), and injuries\(^a\) (4 percent).\(^1\) With the COVID-19 pandemic beginning in early 2020, hospital utilization changed considerably, as areas of the country saw spikes in COVID-19 cases and subsequent hospitalizations. Hospitalizations related to COVID-19 varied by State and across time.\(^2\) The Centers for Disease Control and Prevention (CDC) reported higher rates of COVID-19 cases among adults aged 60 years and younger,\(^3\) but little is known about the impact of the initial period of the pandemic on hospitalizations and in-hospital deaths overall for adults aged 18–64 years.

This Healthcare Cost and Utilization Project (HCUP) Statistical Brief presents data from 29 States on hospitalizations for adults aged 18–64 years across time periods with a focus on the initial impact of the COVID-19 pandemic. The number of hospitalizations and in-hospital deaths for patients aged 18–64 years is presented overall and by patient characteristics from April to December 2020 compared with State-level averages from April to December 2016–2019. The percentages of all hospitalizations and in-hospital deaths related to COVID-19 for adults aged 18–64 years during the April–December 2020 timeframe are also provided. Because of the large sample size of the HCUP data, small differences can be statistically significant but not meaningful. Thus, only differences greater than or equal to 10 percent are discussed in the text.

This analysis is limited to discharges for adults aged 18–64 years treated in community, nonrehabilitation hospitals in 29 States (Arizona, California, Connecticut, Georgia, Illinois, Indiana, Iowa, Kansas, Kentucky, Louisiana, Maine, Maryland, Michigan, Minnesota, Mississippi, Missouri, New Jersey, New York, North Dakota, Ohio, Oregon, Pennsylvania, South Carolina, South Dakota, Tennessee, Vermont, Virginia, Washington, and Wisconsin) for which HCUP data were available for April–December 2016–2019 (State Inpatient Databases [SID]) and April–December 2020 (quarterly inpatient

\(^a\) Each hospitalization was assigned to a single hospitalization type hierarchically, based on the following order of hospital stay principal diagnoses: maternal, neonatal, mental health/substance use, injury, surgical, and medical.
data). These States accounted for 67.7 percent of the resident U.S. population of adults aged 18–64 years in 2019. Information contained in this Statistical Brief was primarily obtained from the HCUP Summary Trend Tables. The Summary Trend Tables, accessed as downloadable tables, provide State-specific monthly trends in hospital utilization for the most recent HCUP data available. These tables were also used to create the HCUP Visualization of Inpatient Trends in COVID-19 and Other Conditions and will be updated as more quarterly data become available.

Findings

State-level hospitalizations and in-hospital deaths for adults aged 18–64 years, 2016–2019 and 2020

Figure 1 displays the number of hospitalizations and in-hospital deaths among adults aged 18–64 years for each of the 29 States in April–December 2016–2019 and 2020. Each dot in the figure represents the State-specific number of hospitalizations or in-hospital deaths. The average number of hospitalizations and in-hospital deaths across these 29 States is also presented (black horizontal bar).

- On average, the number of all hospitalizations for adults aged 18–64 years in the 29 States examined decreased 18.4 percent in the second quarter of 2020 (April–June) compared with the same quarter in 2016–2019 (about 98,000 vs. 80,000 hospitalizations).

- On average, the number of all-cause in-hospital deaths among patients aged 18–64 years in the 29 States examined increased 36.4 percent, 27.3 percent, and 45.5 percent in the second (April–June; about 1,100 to 1,500 deaths), third (July–September; about 1,100 to 1,400 deaths), and fourth (October–December; about 1,100 to 1,600 deaths) quarters of 2020 compared with the same quarters in 2016–2019, respectively.

---

b Counts for 2016–2019 represent the mean number of hospitalizations or in-hospital deaths during April–December across these 4 years.
Figure 1. Number of hospitalizations (in thousands) and in-hospital deaths among adults aged 18–64 years by quarter, April–December 2020 compared with the average of April–December 2016–2019, 29 States

Notes: Number of in-hospital deaths is rounded to the nearest hundred. Counts for 2016–2019 represent the mean number of hospitalizations or in-hospital deaths during April–December across these 4 years. Each dot in the figure represents the State-specific number of hospitalizations or in-hospital deaths.

Source: Agency for Healthcare Research and Quality (AHRQ), Healthcare Cost and Utilization Project (HCUP), 2016–2019 State Inpatient Databases (SID) and 2020 quarterly data from 29 States (AZ, CA, CT, GA, IA, IL, IN, KS, KY, LA, MD, ME, MI, MN, MO, MS, ND, NJ, NY, OH, OR, PA, SC, SD, TN, VA, VT, WA, and WI) (available as of October 2021)
Figure 2 presents the number of hospitalizations and in-hospital deaths for adults aged 18–64 years by census region, comparing April–December 2020 with the average from April–December 2016–2019. The percentage of hospitalizations and in-hospital deaths related to COVID-19 in April–December 2020 is also presented. Similar State-level data are provided in the Appendix.

The number of all hospitalizations for adults aged 18–64 years decreased in April–December 2020 compared with the average in April–December 2016–2019 for all regions based on the 29 States examined. Examined States in the Northeast had a 17.5 percent decrease in hospitalizations (from 1.9 to 1.6 million hospitalizations). The number of hospitalizations for adults aged 18–64 years in New Jersey had the largest decrease of examined States, with a 20.8 percent reduction in hospitalizations (from 331,400 to 262,500 hospitalizations) (see Appendix).

Across 29 States, 6.6 percent of all hospitalizations were related to COVID-19 in April–December 2020, ranging from 6.2 percent in the Northeast to 7.0 percent in the South and West. The percentage of COVID-19-related hospitalizations for adult patients in the 29 examined States ranged from 0.9 percent in Vermont to 10.0 percent in New Jersey (see Appendix).

The number of all-cause in-hospital deaths among patients aged 18–64 years in April–December 2020 versus the average in April–December 2016–2019 increased for all census regions based on the 29 States examined. The number of in-hospital deaths increased 42.1 percent (from 20,200 to 28,700 deaths) in the Northeast. By State, the increase was largest in Arizona, where the number of in-hospital deaths for adult patients increased by 88.5 percent (from 2,600 to 4,900 deaths) (see Appendix).

Across the 29 States, 26.2 percent of in-hospital deaths among patients aged 18–64 years were related to COVID-19 in April–December 2020. In the Northeast, 31.3 percent of in-hospital deaths among patients aged 18–64 years were related to COVID-19. Rates ranged from 4.1 percent in Maine to 46.1 percent in New Jersey (see Appendix).

Counts for 2016–2019 represent the mean number of hospitalizations or in-hospital deaths during April–December across these 4 years.
Figure 2. Number of hospitalizations, in-hospital deaths, and percentage of each related to COVID-19 among adults aged 18–64 years in April–December 2020 compared with the average of all hospitalizations in April–December 2016–2019, 29 States

Notes: Number of hospitalizations and in-hospital deaths is rounded to the nearest hundred. Counts for 2016–2019 represent the mean number of hospitalizations or in-hospital deaths during April–December across these 4 years. // indicates a break in the axis.
* Percentage of the resident U.S. population of adults aged 18–64 years in the specified region in 2019.
Source: Agency for Healthcare Research and Quality (AHRQ), Healthcare Cost and Utilization Project (HCUP), 2016–2019 State Inpatient Databases (SID) and 2020 quarterly data from 29 States (AZ, CA, CT, GA, IA, IL, IN, KS, KY, LA, MD, ME, MI, MN, MO, MS, ND, NJ, NY, OH, OR, PA, SC, SD, TN, VA, VT, WA, and WI) (available as of October 2021)
Patient characteristics associated with hospitalizations and in-hospital deaths for adults aged 18–64 years, 2016–2019 and 2020

Figure 3 presents the number of hospitalizations and in-hospital deaths for adults aged 18–64 years in 29 States combined, by location of patient residence, comparing April–December 2020 with the average from April–December 2016–2019. The percentage of hospitalizations and in-hospital deaths related to COVID-19 in April–December 2020 is also presented.

- The number of all hospitalizations for adults aged 18–64 years decreased 12.7 percent, 10.9 percent, and 13.0 percent in April–December 2020 compared with the average in April–December 2016–2019 in large metro areas (5.0 to 4.3 million hospitalizations), medium/small metro areas (2.4 to 2.1 million hospitalizations), and rural areas (1.2 to 1.1 million hospitalizations), respectively.

At the beginning of the pandemic, across the 29 States with available data, the percentage of hospitalizations related to COVID-19 among patients aged 18–64 years was higher for patients residing in large metro versus other areas (7.3 vs. 5.8 percent).

- The number of all-cause in-hospital deaths among patients aged 18–64 years increased 42.2 percent, 27.6 percent, and 29.3 percent among hospitalizations for patients from large metro areas (53,100 to 75,500 deaths), medium/small metro areas (27,900 to 35,600 deaths), and rural areas (15,700 to 20,300 deaths), respectively, in April–December 2020 versus the average in April–December 2016–2019.

Nearly 3 in 10 in-hospital deaths among hospitalizations for patients aged 18–64 years residing in large metro areas (29.5 percent) were COVID-19 related in April–December 2020.

Figure 3. Number of hospitalizations, in-hospital deaths, and percentage of each related to COVID-19 among adults aged 18–64 years by location of patient residence in April–December 2020 compared with the average of all hospitalizations in April–December 2016–2019, 29 States

Notes: Number of hospitalizations and in-hospital deaths is rounded to the nearest hundred. Counts for 2016–2019 represent the mean number of hospitalizations or in-hospital deaths during April–December across these 4 years.

Source: Agency for Healthcare Research and Quality (AHRQ), Healthcare Cost and Utilization Project (HCUP), 2016–2019 State Inpatient Databases (SID) and 2020 quarterly data from 29 States (AZ, CA, CT, GA, IA, IL, IN, KS, KY, LA, MD, ME, MI, MN, MO, MS, ND, NJ, NY, OH, OR, PA, SC, SD, TN, VA, VT, WA, and WI) (available as of October 2021)

□ Counts for 2016–2019 represent the mean number of hospitalizations or in-hospital deaths during April–December across these 4 years.
Figure 4 presents the number of hospitalizations and in-hospital deaths for adults aged 18–64 years in 29 States combined, by patient race/ethnicity, comparing April–December 2020 with the average from April–December 2016–2019. The percentage of hospitalizations and in-hospital deaths related to COVID-19 in April–December 2020 is also presented.

The number of hospitalizations for adults aged 18–64 years decreased by at least 10 percent in April–December 2020 versus the average in April–December 2016–2019 for non-Hispanic White patients (15.7 percent; 5.1 to 4.3 million hospitalizations) and non-Hispanic Black patients (10.0 percent; 1.6 to 1.5 million hospitalizations).

In April–December 2020, the percentage of hospitalizations related to COVID-19 among patients aged 18–64 years ranged from 4.5 percent for non-Hispanic White patients to 12.8 percent for Hispanic patients.

The number of all-cause in-hospital deaths among patients aged 18–64 years increased in April–December 2020 versus the average in April–December 2016–2019 for all race/ethnicity groups. The smallest increase was for non-Hispanic White adult patients (17.7 percent; from 58,300 to 68,600 deaths), while the number for Hispanic adult patients more than doubled (115.4 percent; from 9,100 to 19,600 deaths). The number of in-hospital deaths for non-Hispanic Black adult patients aged 18–64 years increased 44.3 percent (from 19,200 to 27,700 deaths).

Overall, 17.2 percent of all in-hospital deaths among non-Hispanic White adults aged 18–64 years were COVID-19 related in April–December 2020, while nearly half (49.9 percent) of in-hospital deaths for Hispanic adults were related to COVID-19.
Figure 5 presents the number of hospitalizations and in-hospital deaths for adults aged 18–64 years in 29 States combined, by primary expected payer, comparing April–December 2020 with the average from April–December 2016–2019. The percentage of hospitalizations and in-hospital deaths related to COVID-19 in April–December 2020 is also presented.

- The number of all hospitalizations for adults aged 18–64 years decreased in April–December 2020 versus the average in April–December 2016–2019 for all expected payers, with the largest decrease among hospitalizations with an expected payer of Medicare (18.8 percent; 1.4 to 1.1 million hospitalizations).

In April–December 2020, the percentage of hospitalizations related to COVID-19 among patients aged 18–64 years was lowest for hospitalizations with Medicaid as an expected payer (5.7 percent) and similar for all other expected payers.

- The number of all-cause in-hospital deaths among patients aged 18–64 years increased in April–December 2020 versus the average in April–December 2016–2019 for all expected payers, ranging from a 28.6 percent increase for stays with an expected payer of Medicare (24,800 to 31,900 deaths) to a 48.1 percent increase for those with an expected payer of Medicaid (29,100 to 43,100 deaths).

The percentage of adult in-hospital deaths related to COVID-19 among patients aged 18–64 years in April–December 2020 ranged from 20.7 percent for stays with self-pay/no charge as an expected payer to 28.4 percent for stays with private insurance as an expected payer.

Source: Agency for Healthcare Research and Quality (AHRQ), Healthcare Cost and Utilization Project (HCUP), 2016–2019 State Inpatient Databases (SID) and 2020 quarterly data from 29 States (AZ, CA, CT, GA, IA, IL, IN, KS, KY, LA, MD, ME, MI, MN, MO, MS, ND, NJ, NY, OH, OR, PA, SC, SD, TN, VA, VT, WA, and WI) (available as of October 2021)

Counts for 2016–2019 represent the mean number of hospitalizations or in-hospital deaths during April–December across these 4 years.
Figure 6 presents the number of hospitalizations and in-hospital deaths for adults aged 18–64 years in 29 States combined, by community-level income, comparing April–December 2020 with the average from April–December 2016–2019. The percentage of hospitalizations and in-hospital deaths related to COVID-19 in April–December 2020 is also presented.

- The number of all hospitalizations for adults aged 18–64 years decreased more for patients residing in the highest income areas (14.6 percent; from 1.7 to 1.4 million hospitalizations) compared with patients from the middle (11.9 percent; from 4.2 to 3.7 million hospitalizations) and the lowest (11.9 percent; from 2.6 to 2.3 million hospitalizations) income areas in April–December 2020 versus the average in April–December 2016–2019.

In April–December 2020, the percentage of hospitalizations related to COVID-19 for patients aged 18–64 years was highest (7.3 percent) among hospitalizations for patients residing in the lowest income quartile.

- The number of all-cause in-hospital deaths among patients aged 18–64 years increased in April–December 2020 versus the average in April–December 2016–2019 for hospitalizations for patients from all income quartiles. The increase was largest for patients residing in the lowest income quartile (42.0 percent; 32,600 to 46,300 deaths).

Across the 29 States, the percentage of in-hospital deaths related to COVID-19 among patients aged 18–64 years in April–December 2020 was highest for patients residing in the lowest income quartile (27.6 percent) and lowest for patients residing in the highest income quartile (23.7 percent).

Notes: Number of hospitalizations and in-hospital deaths is rounded to the nearest hundred. Data calculations are suppressed for counts <11 and denoted with a “–”.

* Counts for 2016–2019 represent the mean number of hospitalizations or in-hospital deaths during April–December across these 4 years.

Source: Agency for Healthcare Research and Quality (AHRQ), Healthcare Cost and Utilization Project (HCUP), 2016–2019 State Inpatient Databases (SID) and 2020 quarterly data from 29 States (AZ, CA, CT, GA, IA, IL, IN, KS, KY, LA, MD, ME, MI, MN, MO, MS, ND, NJ, NY, OH, OR, PA, SC, SD, TN, VA, VT, WA, and WI) (available as of October 2021)

About Statistical Briefs

Healthcare Cost and Utilization Project (HCUP) Statistical Briefs provide basic descriptive statistics on a variety of topics using HCUP administrative healthcare data. Topics include hospital inpatient, ambulatory surgery, and emergency department use and costs, quality of care, access to care, medical conditions, procedures, and patient populations, among other topics. The reports are intended to generate hypotheses that can be further explored in other research; the reports are not designed to answer in-depth research questions using multivariate methods.

Data Source

The estimates in this Statistical Brief are based upon data from the HCUP 2016–2019 State Inpatient Databases (SID) and 2020 quarterly inpatient data. Information based on quarterly data should be considered preliminary, as additional quarterly data may become available over time. This analysis is limited to adult patients aged 18–64 years treated in community, nonrehabilitation hospitals in 29 States (Arizona, California, Connecticut, Georgia, Illinois, Indiana, Iowa, Kansas, Kentucky, Louisiana, Maine, Maryland, Michigan, Minnesota, Mississippi, Missouri, New Jersey, New York, North Dakota, Ohio, Oregon, Pennsylvania, South Carolina, South Dakota, Tennessee, Vermont, Virginia, Washington, and Wisconsin) for which HCUP data were available for April–December 2016–2019 and April–December 2020. These States account for the following percentages of the resident U.S. adult population aged 18–64 years: 67.7 percent of the total population, 69.4 percent of the non-Hispanic White population, 68.2 percent of the non-Hispanic Black population, 59.8 percent of the Hispanic population, and 71.8 percent of the other non-Hispanic race/ethnicity population, including but not limited to American Indian, Alaska Native, Asian, Native Hawaiian, and other Pacific Islander. All of the information for 2020 contained in this Statistical Brief can be found in the HCUP Summary Trend Tables at www.hcup-us.ahrq.gov/reports/trendtables/summariantrendtables.jsp.
The HCUP inpatient data contain the universe of the inpatient discharge abstracts in the participating HCUP States, translated into a uniform format to facilitate multistate comparisons and analyses. The inpatient data encompass more than 95 percent of all U.S. community hospital discharges. The inpatient data can be used to investigate questions unique to one State, to compare data from two or more States, to conduct market-area variation analyses, and to identify State-specific trends in inpatient care utilization, access, charges, and outcomes.

**Types of hospitals included in HCUP State Inpatient Databases (and quarterly inpatient data)**

This analysis used SID and quarterly inpatient data limited to information from community hospitals, which are defined as short-term, non-Federal, general, and other hospitals, excluding hospital units of other institutions (e.g., prisons). Community hospitals include obstetrics and gynecology, otolaryngology, orthopedic, cancer, pediatric, public, and academic medical center hospitals. Excluded for this analysis are long-term care facilities such as rehabilitation, psychiatric, and alcoholism and chemical dependency hospitals. However, if a patient received long-term care, rehabilitation, or treatment for a psychiatric or chemical dependency condition in a community hospital, the discharge record for that stay was included in the analysis.

**Definitions**

**Diagnoses and ICD-10-CM**

The principal diagnosis is that condition established after study to be chiefly responsible for the patient’s admission to the hospital. Secondary diagnoses are conditions that coexist at the time of admission that require or affect patient care treatment received or management, or that develop during the inpatient stay. All-listed diagnoses include the principal diagnosis plus the secondary conditions.

ICD-10-CM is the International Classification of Diseases, Tenth Revision, Clinical Modification. There are over 70,000 ICD-10-CM diagnosis codes.

**Case definition**

COVID-19-related hospitalizations and in-hospital deaths, defined by the discharge disposition, are identified by any-listed ICD-10-CM code of U07.1 (2019 novel coronavirus disease) on the discharge record. Per coding guidelines, the use of U07.1 is based on documentation by the provider or documentation of a positive COVID-19 test result. The ICD-10-CM code for COVID-19 was implemented beginning April 1, 2020. As such, there may be some measurement error in the identification of cases.

**Unit of analysis**

The unit of analysis is the hospital discharge (i.e., the hospital stay), not a person or patient. This means that a person who is admitted to the hospital multiple times in 1 year will be counted each time as a separate discharge from the hospital.

**Location of patients’ residence**

Place of residence is based on the urban-rural classification scheme for U.S. counties developed by the National Center for Health Statistics (NCHS) and based on the Office of Management and Budget (OMB) definition of a metropolitan service area as including a city and a population of at least 50,000 residents. For this Statistical Brief, we collapsed the NCHS codes into the following three categories:

Large metropolitan (metro) area:

- Large Central Metropolitan: Counties in a metropolitan area with 1 million or more residents that satisfy at least one of the following criteria: (1) containing the entire population of the largest principal city of the metropolitan statistical area (MSA), (2) having their entire population contained within the largest principal city of the MSA, or (3) containing at least 250,000 residents of any principal city in the MSA
- Large Fringe Metropolitan: Counties in a metropolitan area with 1 million or more residents that do not qualify as large central metropolitan counties

---

Medium/small metro area:

- Medium Metropolitan: Counties in a metropolitan area of 250,000–999,999 residents
- Small Metropolitan: Counties in a metropolitan area of 50,000–249,999 residents

Rural area:

- Micropolitan: Counties in a nonmetropolitan area of 10,000–49,999 residents
- Noncore: Counties in a nonmetropolitan and nonmicropolitan area

**Reporting of race and ethnicity**

Data on Hispanic ethnicity are collected differently among the States and also can differ from the census methodology of collecting information on race (White, Black, Asian/Pacific Islander, American Indian/Alaska Native, Other [including mixed race]) separately from ethnicity (Hispanic, non-Hispanic). State data organizations often collect Hispanic ethnicity as one of several categories that include race. Therefore, for multistate analyses, HCUP creates the combined categorization of race and ethnicity for data from States that report ethnicity separately. When a State data organization collects Hispanic ethnicity separately from race, HCUP uses Hispanic ethnicity to override any other race category to create a Hispanic category for the uniformly coded race/ethnicity data element, while also retaining the original race and ethnicity data. This Statistical Brief reports race/ethnicity for the following categories: Hispanic, non-Hispanic White, non-Hispanic Black, and non-Hispanic Other (Asian/Pacific Islander, American Indian/Alaska Native, Other).

**Expected payer**

To make coding uniform across all HCUP data sources, the primary expected payer for the hospital stay combines detailed categories into general groups:

- Medicare: includes fee-for-service and managed care Medicare
- Medicaid: includes fee-for-service and managed care Medicaid
- Private insurance: includes commercial nongovernmental payers, regardless of the type of plan (e.g., private health maintenance organizations [HMOs], preferred provider organizations [PPOs])
- Self-pay/No charge: includes self-pay, no charge, charity, and no expected payment
- Other payers: includes other Federal and local government programs (e.g., TRICARE, CHAMPVA, Indian Health Service, Black Lung, Title V) and Workers’ Compensation

Due to variability in coding in “other” payer by State (from 1.6 to 7.4 percent) and difficulty with interpretation, estimates of “other” expected payers were excluded from the Statistical Brief. Less than 0.01 percent of discharges were missing information on expected payer.

Prior to 2017, hospital stays that were expected to be billed to the State Children’s Health Insurance Program (SCHIP) may be classified as Medicaid or Other, depending on the structure of the State program. Because most State data do not identify SCHIP as a separate expected payer, it is not possible to present this information separately. Beginning with 2017 data, hospital stays that were expected to be billed to SCHIP are included under Medicaid.

For this Statistical Brief, when more than one payer is listed for a hospital discharge, the first-listed payer is used.

**Community-level income**

Community-level income is based on the median household income of the patient’s ZIP Code of residence. Quartiles are defined so that the total U.S. population is evenly distributed. Cut-offs for the quartiles are determined annually using ZIP Code demographic data obtained from Claritas, a vendor that produces population estimates and projections based on data from the U.S. Census Bureau. The value ranges for the income quartiles vary by year. Patients in the first quartile are assigned to the *lowest* income category, patients in the middle two quartiles are assigned to the *middle* income category, and

---

patients in the highest quartile are assigned to the highest income category. The income quartile is missing for patients who are homeless or foreign.

About HCUP

The Healthcare Cost and Utilization Project (HCUP, pronounced “H-Cup”) is a family of healthcare databases and related software tools and products developed through a Federal-State-Industry partnership and sponsored by the Agency for Healthcare Research and Quality (AHRQ). HCUP databases bring together the data collection efforts of State data organizations, hospital associations, and private data organizations (HCUP Partners) and the Federal government to create a national information resource of encounter-level healthcare data. HCUP includes the largest collection of longitudinal hospital care data in the United States, with all-payer, encounter-level information beginning in 1988. These databases enable research on a broad range of health policy issues, including cost and quality of health services, medical practice patterns, access to healthcare programs, and outcomes of treatments at the national, State, and local market levels.

HCUP would not be possible without the contributions of the following data collection Partners from across the United States:

- **Alaska** Department of Health and Social Services
- **Alaska** State Hospital and Nursing Home Association
- **Arizona** Department of Health Services
- **Arkansas** Department of Health
- **California** Office of Statewide Health Planning and Development
- **Colorado** Hospital Association
- **Connecticut** Hospital Association
- **Delaware** Division of Public Health
- **District of Columbia** Hospital Association
- **Florida** Agency for Health Care Administration
- **Georgia** Hospital Association
- **Hawaii** Laulima Data Alliance
- **Hawaii** University of Hawai‘i at Hilo
- **Illinois** Department of Public Health
- **Indiana** Hospital Association
- **Iowa** Hospital Association
- **Kansas** Hospital Association
- **Kentucky** Cabinet for Health and Family Services
- **Louisiana** Department of Health
- **Maine** Health Data Organization
- **Maryland** Health Services Cost Review Commission
- **Massachusetts** Center for Health Information and Analysis
- **Michigan** Health & Hospital Association
- **Minnesota** Hospital Association
- **Mississippi** State Department of Health
- **Missouri** Hospital Industry Data Institute
- **Montana** Hospital Association
- **Nebraska** Hospital Association
- **Nevada** Department of Health and Human Services
- **New Hampshire** Department of Health & Human Services
- **New Jersey** Department of Health
- **New Mexico** Department of Health
- **New York** State Department of Health
- **North Carolina** Department of Health and Human Services
- **North Dakota** (data provided by the Minnesota Hospital Association)
- **Ohio** Hospital Association
- **Oklahoma** State Department of Health
- **Oregon** Association of Hospitals and Health Systems
- **Oregon** Office of Health Analytics
- **Pennsylvania** Health Care Cost Containment Council
- **Rhode Island** Department of Health
- **South Carolina** Revenue and Fiscal Affairs Office
- **South Dakota** Association of Healthcare Organizations
- **Tennessee** Hospital Association
- **Texas** Department of State Health Services
- **Utah** Department of Health
- **Vermont** Association of Hospitals and Health Systems
- **Virginia** Health Information
- **Washington** State Department of Health
- **West Virginia** Department of Health and Human Resources, West Virginia Health Care Authority
- **Wisconsin** Department of Health Services
- **Wyoming** Hospital Association
